ABOUT THE CLINICAL ONCOLOGY COURSE.....

Although there has been rapid advances in the field of Oncology in the last few decades with state of the art technology creating modern machines and targeted drugs, the basic foundations of treatment remain multidisciplinary care.

For residents entering the field of Oncology, a good grasp of the comprehensive stage wise management of common Cancers of different sub sites with emphasis on basic concepts of Radiation and Clinical Oncology is vital.

Our aim is to provide this knowledge through a structured course aimed at JR1s and JR2s mainly which should act as a stepping stone for further in depth evidence based learning.

Every module has been created after critical self appraisal and peer review with the concepts in mind. Continuous and end of course evaluation will ensure bidirectional learning.

At the end if the Course, participants should -

- Have a basic idea about the functional anatomy and physiology of different sub sites and its importance vis a vis the respective Cancers
- Have knowledge of basic Workup including aspects of Imaging, Pathology and relevant Molecular Genetics for common Cancers
- Have a clear and concise idea about basics of stage wise management of common cancers
- Have a good idea on common Radiation techniques, portals, target volumes and doses and toxicities for common malignancies
- Have a good idea on common systemic therapy agents (chemotherapy, endocrine therapy, targeted therapy) including doses and toxicities
